Report submitted to

Dr. Firdaus Bashir Assistant Professor

PSG INSTITUTE OF MANAGEMENT COIMBATORE

DECLARATION

We, the undersigned, hereby declare that the project report submitted as part of the **Social Sensitization for Managers course at PSG Institute of Management**, Coimbatore, is the result of our original work carried out by our team of four members. This project has not been submitted to any other institution or university for the award of any degree, diploma, or certificate. All sources of information used in this report have been duly acknowledged and referenced. Any resemblance to other published or unpublished works is purely coincidental. We affirm that we have adhered to the principles of academic integrity and honesty throughout the preparation and presentation of this report.

Team Members

SATHISH KUMAR B (25AB06)

DEEPAK KINGSTON S (25AB12)

HARISHIKA S (25AB21)

NITHISH SHRIRAM SS (25AB32)

SRI SHAKTHI VARSHINI P (25AB49)

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to the following individuals and organizations for their invaluable guidance and support in the successful completion of our Social Sensitization for Managers project.

We extend our heartfelt thanks to the Director Dr. V. Srividya PSG Institute of Management, for providing us the opportunity to undertake this project as part of the MBA curriculum. The institution's constant encouragement, resources, and academic environment greatly facilitated the smooth execution of our work.

We are deeply indebted to our Guide, Dr. Firdaus Bashir, Assistant Professor of PSG Institute of Management, for her insightful guidance, valuable feedback, and unwavering support throughout the project. Her vision and leadership have been instrumental in shaping the direction and objectives of this study.

Finally, we express our gratitude to **GREEN ERA RECYCLERS**, for graciously permitting us to conduct this project within their organization. Their support and cooperation were crucial to the successful completion of our study.

1.INTRODUCTION

Electronic waste, or e-waste, has become one of the fastest-growing waste streams in urban India, driven by rapid technological advancement and shorter device lifecycles. Coimbatore, being a major commercial and industrial hub, generates significant volumes of electronic waste through households, service shops, and retail vendors.

Despite this rise, awareness about responsible e-waste disposal and access to formal recycling channels remain limited. As a result, a majority of discarded electronic components end up in informal scrap markets, open dumping sites, or general waste streams, posing risks to public health and the environment.

The title “Tracking Tech Traces: E-Waste to Zero Waste” captures what our project truly stands for. Today, almost everyone uses electronic gadgets, but very few of us know what happens to them once they stop working. This project focuses on that hidden journey. It symbolizes our effort to follow the “tech traces” left behind by every device—from daily use, to disposal, and finally to proper recycling

Recognizing this gap, our team embarked on a project focused on E-Waste Management, in collaboration with Green Era Recyclers, a certified e-waste recycling organization in Coimbatore. The project was designed to align with SDG 11 – Sustainable Cities and Communities, especially Target 11.6, which emphasizes reducing the adverse environmental impact of cities through improved waste management.

2.DESCRPTION OF THE PROBLEM IDENTIFIED

Rapid urbanization and technological advancements have resulted in a surge in electronic waste (e-waste) generation. This situation is clearly visible in Coimbatore, where the usage of electronic devices has increased in almost every shop, household, and commercial space. Areas like Gandhipuram, Peelamedu, Singanallur, Hopes, and Ukkadam are some of the busiest parts of the city, and naturally, the amount of e-waste generated here is much higher. With shops regularly updating their devices, replacing damaged systems, and discarding old equipment, the overall volume of e-waste keeps increasing every day.

In these locations, improper disposal of discarded electronics has become a major concern. Most vendors and residents either sell e-waste to informal scrap dealers or dump it with general waste. This happens mainly because they are unaware of the hazardous effects electronic items can cause when handled carelessly. Since many people treat e-waste just like normal waste, they do not think about the long-term consequences. The lack of proper knowledge leads to e-waste being thrown into regular dustbins, roadside areas, or mixed with daily waste from the shops.

There is also a lack of awareness, limited access to authorized recyclers, and no proper collection system linking vendors with certified recycling agencies. Many shop owners do not know where to give their e-waste or whom to approach for responsible disposal. Even when they want to dispose of electronics correctly, the absence of a clear and simple process prevents them from doing so. Because of this, the informal sector becomes the easiest option for them, even though it does not follow safe recycling methods.

These factors contribute to environmental pollution, health hazards, and the wastage of recyclable materials. When e-waste gets mixed with general waste or dumped in open places, it slowly affects the surroundings. Over time, this creates unnecessary pollution and reduces the quality of the environment in busy commercial areas. At the same time, many materials that could have been reused or recycled end up being wasted.

Hence, we are collaborating with the company Green Era Recyclers to identify, collect, and sustainably recycle the generated e-waste. This partnership helps create a proper link between the vendors and an authorized recycling company. The collected e-wastes are categorized into yieldable e-wastes, where some useful or valuable parts can be recovered and sold for money, and non-yieldable e-wastes, where no useful or valuable parts can be recovered. This system ensures that every type of e-waste is handled responsibly and in an organized manner.

3.SDG GOALS

SDG 11 – Sustainable Cities and Communities

TARGETS AND INDICATORS COVERED:

Target 11.6: To reduce the environmental impact caused by the e-wastes in Gandhipuram, Ukkadam and Peelamedu by promoting proper e-waste collection and safe recycling.

INDICATORS

Amount of e-waste collected: Measured in kilograms or tonnes, this indicator reflects the total electronic waste gathered from the vendors and shops in Gandhipuram, Ukkadam and Peelamedu. It shows the effectiveness of the collection drives and the reduction of e-wastes ending up in the landfills or being dumped unsafely.

4.STAKEHOLDERS IMPACTED

1. Local Vendors and Shopkeepers

Local vendors, repair shop owners, and small electronic service providers in areas like Gandhipuram, Peelamedu, and Singanallur play a major role as stakeholders. Most of these vendors deal with a large number of electronic parts every day. When they receive damaged items or unusable components from customers, they usually sell these parts to informal scrap dealers because it is fast and convenient. However, they often do this without full knowledge of the environmental and health problems created by informal recycling and unsafe dismantling practices.

With the introduction of this project, vendors become more aware of the long-term impact of such practices. By participating in organized collection drives, they contribute directly to sustainable recycling and responsible waste management. This not only helps the environment but also builds a positive image for their shops. Customers start seeing them as responsible and trustworthy, which can improve their reputation and customer relationships. Over time, this responsible behaviour creates a healthier business environment in these commercial areas.

2. Green Era Recyclers (Certified E-Waste Management Company)

Green Era Recyclers, the certified e-waste management company partnering with us, is another major stakeholder benefitting from the project. As an authorized recycler, they depend on the collection of e-waste from different sources to carry out proper and eco-friendly recycling processes. Through this project, they receive a more consistent and organized flow of e-waste, which improves both their efficiency and reach.

The project also strengthens their presence in the community by creating more awareness about their role and services. When more vendors and residents start using formal disposal channels, the company gains greater trust and credibility. This leads to stronger relationships with the community and opens up opportunities for future collaborations with institutions, shops, and residential areas. Overall, the project helps Green Era Recyclers expand their network and contribute more effectively to sustainable waste management in the city.

5.WEEKLY DESCRIPTION

WEEK 1:

In the initial part of this project, our team gathered detailed information about the organization Green Era Recyclers, a certified e-waste recycling company based in Coimbatore. Before approaching them, we carefully went through their background, the type of waste they handle, the services they provide, and their existing collection process.

Once we had a clear understanding, we proceeded to contact them requesting support for the upcoming activity. During our conversations, we learnt about their specific e-waste management needs and the recycling process they follow from start to finish. They explained how electronics are collected, sorted, dismantled, and recycled in a safe manner.

We communicated our interest in working with them and shared the objective of our project. The company responded positively, showing interest in collaborating with us. By the end of the week, we were able to set up a formal meeting to further discuss how we could contribute to their e-waste management efforts, which areas in Coimbatore required immediate attention, and how we could begin our work effectively and systematically.

WEEK 2:

During the second week, our team coordinated internally and held discussions to decide where we should start our fieldwork. After considering various locations, we identified some major areas such as Gandhipuram, Ukkadam, and Peelamedu, which have a high number of electronics shops. These areas were chosen because they are busy commercial zones and generate a significant amount of e-waste on a daily basis.

We visited these areas with the intention of gathering first-hand insights from the shops. These visits were extremely helpful, as they gave us a clear understanding of the current methods vendors and shopkeepers use to dispose of their e-waste.

Some shops stored old electronics in boxes, some disposed of them along with general waste, and others sold them to informal scrap dealers. These direct observations helped us understand the existing gaps and prepared us for the next steps of our project.

WEEK 3 & 4:

In weeks three and four, we planned and conducted detailed surveys in the shops identified earlier. We created a simple yet effective set of questions to collect information regarding how much e-waste each shop generated, their current disposal practices, and their level of awareness about responsible recycling.

As we collected the responses, we structured all the data in an Excel format so it would be easy to analyze later. This organized database helped us identify patterns, categorize shops, and understand which areas produced the most e-waste.

To complete the data collection efficiently, our team split into smaller groups and handled different zones. Each team visited multiple shops, interacted with vendors, explained the purpose of the survey, and recorded their responses.

We ensured that we collected information from all types of electronics shops, including mobile stores, laptop repair centres, accessory shops, TV service shops, and stores selling refurbished electronic items. These two weeks formed the core of our data collection phase and gave us a complete picture of the current situation.

WEEK 5 & 6:

Based on the current modes of disposal of e-waste by the vendors and shopkeepers, we provided them with a better and responsible alternative. We suggested that they dispose of and recycle their e-waste sustainably through Green Era Recyclers, instead of giving it to informal scrap dealers or mixing it with general waste.

During our interactions, we explained in simple terms how improper disposal could become harmful over time. Many vendors were unaware that their disposal practices could negatively affect the environment. We shared insights about how hazardous these wastes could turn if not properly recycled and how partnering with an authorized recycler could solve this issue.

These two weeks were more focused on awareness-building. Several shopkeepers appreciated the information provided and showed interest in following better disposal practices. This phase helped bridge the gap between the vendors and the recycling company.

WEEK 7:

In the final week, we met with Green Era Recyclers to discuss further proceedings after our project work was done. During this meeting, we shared our survey findings, the responses received from vendors, and the challenges observed in different areas. We discussed what could be improved, what worked well, and which locations needed continuous follow-up.

We also spoke about the future of the activity after our project was completed. Green Era Recyclers appreciated our work and the effort taken to bring awareness to vendors.

As a result, we were offered opportunities to work with them and collaborate further to continue the project. This gave our team confidence that our efforts had created a real impact that could be extended beyond the project duration.

6.PROJECT PHASES

A three-phase approach was followed:

Phase 1: Identification and Preliminary Assessment

The first phase focused on understanding the geographical distribution and intensity of e-waste generation within the selected urban clusters of **Gandhipuram, Peelamedu, Ukkadam, and adjacent commercial zones**. These locations were chosen based on their high density of electronic shops, repair centres, street-side vendors, and small-scale commercial establishments, all of which contribute significantly to informal e-waste streams.

A detailed **mapping exercise** was carried out to identify potential vendors and establishments that generate e-waste regularly. This included computer and mobile repair shops, appliance service centres, small electronics retailers, and scrap dealers.

To ensure systematic data collection, a set of **survey instruments** was developed. These included structured questionnaires, observation checklists, and vendor interaction templates aimed at capturing data on types of e-waste generated, storage practices, disposal habits, and vendor awareness levels.

Parallely, initial coordination was established with **Green Era Recyclers**, an authorized e-waste recycling organization. Discussions were held to understand their collection capabilities, recycling processes, and requirements for formal collaboration. This early engagement ensured that the data collected would be relevant for designing a feasible collection mechanism in later phases.

Phase 2: Field Visits, Surveys, and Data Collection

The second phase involved extensive **on-site fieldwork** across all identified hotspots. A total of approximately **75 vendors** were surveyed to ensure a comprehensive understanding of e-waste generation patterns in the selected regions. The survey teams visited each vendor individually and conducted structured interviews to collect qualitative and quantitative data.

The assessment covered:

- **Types of e-waste generated:** including yieldable components (valuable metals, reusable parts) and non-yieldable items (damaged plastics, non-recyclables).
- **Frequency of generation:** daily, weekly, or monthly accumulation depending on business type.
- **Existing disposal methods:** selling to scrap dealers, storing for long durations, dumping with municipal waste, or handing over to informal recyclers.
- **Awareness levels:** vendor understanding of environmental impacts and legal guidelines related to e-waste disposal.

During this phase, photographic documentation and observational notes were also taken to provide contextual insights. The data collected helped in identifying key challenges such as lack of awareness, absence of formal collection systems, and dependence on informal scrap networks.

This structured field survey served as the foundation for designing targeted interventions in the next phase.

Phase 3: Collaboration With Recycling Partner and Initiation of Collection Plans

Based on the insights gained from the field assessment, the project entered the third phase, which focused on initiating a **formal partnership with Green Era Recyclers**. The collected data—including vendor locations, estimated e-waste quantities, and disposal patterns—was compiled and shared with the recycling partner to assist them in developing an efficient collection model.

7.TEAM ROLES AND RESPONSIBILITIES:

Deepak Kingston S (25AB12) - Team leader

Overall coordination, communication with Green Era Recyclers, and ensuring smooth communication between our team and the team at Green Era Recyclers.

Satish (25AB06)

Brought up new ideas and pitched them to the organization, assisting in newer methods and ways to collect data.

Nithish Shriram (25AB32)

Manages data, visit retail shops and collect data on their e-waste management systems.

Sri Shakthi Varshini P (25AB49)

Assist with helping to find shops and track the progress of other members. Maintained records and updates of the work as it progressed.

Harishika (25AB21)

Segregate the shops according to the needs of the organization and reject the remaining.

8.ORGANISATION

Aspire • Elate • Recycle

Name: Green Era Recyclers

About:

Green Era Recyclers is an E-waste recycling company with a strong will to do urban mining and to mitigate the impact caused by E-waste accumulation every year. Green Era strives to manage electric and electronic wastes by adopting effective end to end recycling by scientifically and environmentally sound/ eco-friendly disposal practices thus promising maximum resource recovery and zero landfill of E-wastes and to put a permanent halt to the vicious degradation of our earth. They are authorised by the Tamil Nadu Pollution Control Board.

CONTACT PERSON

Name: Mr. Prashanth

Designation: Managing Partner

Organization: Green Era Recyclers

Address: SF. No-91/1B, Door No-4/221, Sai Kirthi Industrial Estate, Seerapalayam, Bodipalayam, Coimbatore – 641105

Email: info@thegreenera.in

Website: www.thegreenera.in

Phone: +91 9361328436

Mission:

To promote and disseminate effective green technologies and sustainable recycling processes for environmentally sound management and eco-friendly practices for electrical and electronic wastes.

Vision:

To create a synergy focussing and creating positive impact on major sustainability issues with our initial stride on electronic waste management and solutions.

9. PROPOSED SOLUTIONS

1. Identify Vendors

The first and most important step in our suggestive solution is to identify the vendors who generate electronic waste in their daily operations. These include mobile shops, repair centres, accessory stores, laptop service shops, and other electronics-related businesses. By visiting these shops personally, we are able to understand which vendors have unused, damaged, or discarded electronic items. This step ensures that the e-waste is collected directly from the right source, rather than after it has been mixed with general waste. Identifying vendors early also helps us get a clear picture of how much e-waste each shop produces and how frequently they need disposal support. This targeted identification makes the entire process systematic and prevents unnecessary delays in collection. It also allows the vendors to feel involved and aware that a proper system is being designed for their benefit.

2. Inform Green Era Recyclers

Once the vendors are identified, the next step in the process is to inform Green Era Recyclers about the locations and details of these shops. We prepare a simple list containing the shop name, address, contact number, and the type of e-waste they possess. By passing these details to the recycling company, we make it easy for them to connect with the vendors directly. This step acts as a bridge between the generator of the waste (vendors) and the authorized recycling agency. It also ensures that Green Era Recyclers can plan their collection route properly and schedule visits without confusion. The smooth flow of information allows both sides to communicate easily, reducing misunderstanding and saving time. Through this process, vendors begin to trust the system because they know that a certified agency is handling their waste.

3. Collection by Green Era Recyclers

After receiving the vendor information, Green Era Recyclers take responsibility for collecting the e-waste in a safe and professional manner. Their trained team visits the shops and ensures that the electronics are packed, handled, and transported without causing any harm. Since e-waste contains components that must be treated carefully, this formal collection method prevents the waste from being mishandled or thrown into open areas. The recycler also ensures that the collected e-waste reaches the recycling facility, where it can be dismantled and processed scientifically. This prevents hazardous materials from leaking into the environment and reduces the chances of improper disposal. The vendors also feel satisfied knowing their waste is being collected responsibly without them having to spend extra time or effort.

4. Awareness to Vendors

Another important part of the solution is spreading awareness to the vendors about why safe e-waste disposal is necessary. Many shopkeepers initially do not know the harmful effects of throwing e-waste along with general waste or selling it to informal scrap dealers. So, we explained to them in simple terms how safe disposal helps protect the environment, prevents soil and air pollution, and reduces long-term health risks. By sharing this knowledge, the vendors understand that recycling e-waste prevents pollution and allows efficient management of valuable materials. This awareness-building step changes the mindset of the vendors and encourages them to take waste disposal seriously. Many vendors also begin to store their e-waste separately once they realize the importance of giving it to an authorized recycler.

5. Encourage Proper Disposal

After creating awareness, the next focus is on motivating vendors to continue disposing of their e-waste responsibly. We encourage them to adopt proper disposal practices and avoid careless dumping, such as throwing old electronics on the roadside or giving them to unregulated scrap dealers. When vendors understand the long-term benefits of responsible disposal, they become more willing to support sustainable recycling. Encouraging proper disposal also helps reduce the amount of hazardous waste entering landfills or public spaces, leading to cleaner and safer surroundings. By cooperating with Green Era Recyclers, vendors also contribute to a cleaner community and feel proud of being part of a positive environmental initiative. Over time, this consistent encouragement builds a habit among vendors to store, separate, and hand over e-waste in a safe manner.

10. PREASSESSMENT

Our team needed to comprehend the actual situation in Coimbatore before the collection actually took place. The busiest electronic hubs, Gandhipuram, Ukkadam, Peelamedu, Singanallur, and Hopes, are where we conducted the pre-assessment survey. The owners of mobile shops, electronic service centers, and repair vendors were contacted door-to-door and asked a straightforward questionnaire. They were asked what type of e-waste they generated, the frequency of generation, and their usual methods of disposal. While some were initially apprehensive, some were quite cooperative.

According to these exchanges, the majority of these vendors lacked a formal system for getting rid of e-waste. Some sold it to scrap dealers, while others kept it for years or three in trash. Many of them had no idea that dangerous substances like lead and mercury could be found in e-waste. We were better able to comprehend the disconnect between awareness and action thanks to this survey. It also demonstrated to us that the majority of people wanted to help, but they were unsure of how to proceed. With this knowledge, we successfully planned the subsequent stage of our project.

11.IDENTIFIED CURRENT GAPS:

We identified a few significant gaps that required attention based on our survey and conversations. The most notable one was ignorance. The majority of the vendors were unaware that the batteries, chargers, and discarded circuit boards they handled on a daily basis could pose a risk to human health and the environment.

The absence of a suitable waste disposal system was another gap. The majority of the vendors were not aware of Green Era or other certified recyclers, and there were no easily accessible collection centres. As a result, the e-waste ended up in landfills or was sold to scrap dealers who handled it in an unsafe manner.

We also observed that there was a minor communication barrier. Some vendors didn't understand the technical terms or felt uncomfortable talking about business specifics. Establishing trust with them required a great deal of patience and time. Overall, we recognized that awareness, accessibility, and appropriate collaboration are the three main areas that require improvement in order to make e-waste management effective

EXECUTION

12.WEEKLY ACTIVITIES CARRIED OUT

WEEK 1:

Understanding the Organization and Initial Coordination

In the initial part of the project, our team gathered detailed information about Green Era Recyclers, a certified e-waste recycling company based in Coimbatore. Before approaching them, we studied their background, the types of waste they handle, the services they offer, and their existing recycling processes.

After gaining clarity, we contacted them to request support for our activity. Through discussions, we learnt about their end-to-end e-waste recycling workflow, including collection, sorting, dismantling, and safe recycling of electronic components.

We communicated our project objectives, and the company responded positively, showing interest in collaborating with us. By the end of the week, we successfully set up a formal meeting to plan how we could assist their e-waste management efforts and identify priority areas for our fieldwork.

WEEK 2:

Area Identification and Initial Field Visits

During the second week, our team coordinated internally to decide the starting point for fieldwork. After discussions, we finalized major commercial hubs such as Gandhipuram, Ukkadam, Hopes and Peelamedu, considering their high concentration of electronics shops and daily e-waste generation.

We visited these areas to observe how vendors currently manage their e-waste. These visits provided first-hand insights: some shops stored old electronics, some disposed of them with general waste, and others sold them to informal scrap dealers. These observations helped us understand the gaps and shaped the direction of our survey.

WEEK 3:

Survey Planning and Initial Data Collection

In the third week, we started with the shops identified earlier. We collected details like the exact quantity of e-waste generated in each shop, current disposal practices etc. We started collecting responses and entered them in an Excel sheet to maintain clear and organized data. This helped us categorize shops and identify patterns in e-waste handling. Week 3 marked the beginning of systematic data gathering.

WEEK 4:

Consolidated Data Collection Across All Zones

During the fourth week, we continued the shop identification and data collection process more extensively. Our team divided into smaller groups to cover multiple locations efficiently.

Each group visited various shops including mobile repair centers, laptop service units, accessory shops, TV service shops, and refurbished goods stores and interacted with vendors to record their responses.

By the end of Week 4, we had collected comprehensive data from all the shortlisted areas, giving us a clear picture of the overall e-waste management scenario.

WEEK 5:

Structuring Collected Data for Analysis

During Week 5, our team shifted focus from field visits to organizing and refining all the information gathered in the previous weeks. We compiled the survey results, verified incomplete entries, and cross-checked the data collected by different groups to ensure consistency.

We categorized the shops based on the type of e-waste they generated, their frequency of disposal, and their interest in collaborating with Green Era Recyclers. This stage helped us clearly distinguish high priority vendors those generating larger volumes of e-waste from smaller shops with minimal waste.

In addition to data compilation, we prepared a preliminary summary to share with Green Era Recyclers. This helped them understand which areas could benefit most from their collection services. Week 5 mainly involved backend work, including documentation, data sorting, and preparing the ground for the next phase.

WEEK 6:

Strengthening Vendor Engagement and Promoting Recycling

Week 6 continued the awareness and engagement efforts. We reinforced the message about the hazards of improper disposal and clarified how partnering with an authorized recycler could benefit vendors and the environment.

Several shopkeepers showed interest in adopting better practices. This week helped strengthen the connection between the vendors and Green Era Recyclers, ensuring that they had a reliable option for safe disposal.

WEEK 7:

Review, Feedback, and Future Collaboration

In the final week, we met with Green Era Recyclers to discuss the progress and share our findings. We presented the survey data, vendor responses, and challenges observed in different areas. We discussed improvements, identified regions needing continued support, and explored the next steps for long-term engagement. Green Era Recyclers appreciated our effort and expressed interest in continuing the collaboration, offering opportunities for future projects. This validated our team's contribution and highlighted the lasting impact of our work.

13. CHALLENGES ENCOUNTERED:

- Inconsistent cooperation from smaller retailers fearing commercial loss.
- Difficulty in tracking e-waste collection due to non-centralized database.
- Lack of Trust from local vendors.
- Lack of awareness among Vendors

14. STEPS TO OVERCOME THE CHALLENGES

Throughout the project, the team faced multiple challenges, such as vendor hesitation, communication barriers, and time constraints. To address these effectively, a series of structured and strategic measures were implemented.

Firstly, to overcome vendor mistrust, the team adopted a personal engagement approach. Each visit began with transparent communication about the project's purpose, emphasizing that it was a student-led social initiative aimed at environmental improvement.

Introduction letters and ID cards issued by the institution were shown to establish credibility and authenticity. Vendors were reassured that no commercial motives were involved and that the data collected would be used solely for academic and environmental purposes.

To mitigate communication barriers, bilingual materials were prepared in both English and Tamil. Team members fluent in Tamil took the lead in conversations, ensuring clarity and comfort for local vendors. Simplified explanations were used to make the concepts of e-waste and recycling easily understandable.

Time management was another major challenge, as academic commitments often clashed with fieldwork. The team designed a well-structured schedule, dividing members into smaller groups and assigning specific regions to optimize time and coverage. Visits were planned during off-peak hours to ensure productive discussions with vendors.

Daily and weekly targets were set and tracked digitally using shared spreadsheets. To strengthen team coordination, a team leader was appointed to oversee communication, monitor progress, and allocate responsibilities.

Regular check-ins and progress reviews were conducted to address any emerging issues promptly.

Through these combined measures authentic engagement, efficient planning, language inclusivity, and structured teamwork the team successfully overcame the operational hurdles and completed the project objectives efficiently.

15.ROLES OF THE INDIVIDUAL PARTICIPANTS DURING EXECUTION

Each member of the Team played a well-defined and critical role throughout the execution phase:

Deepak Kingston S (Team Leader)

Provided overall leadership and coordination, managed communication between the team and Green Era Recyclers, scheduled vendor visits, and ensured smooth progress. His leadership ensured accountability and timely completion of milestones.

Sathish Kumar B

Assisted in communication with the recycling company and the vendors, handled scheduling of field visits, and actively collected vendor data on e-waste generation and disposal practices.

Nithish Shriram SS

Managed documentation, data visualization, and report writing. Involved in vendor visits and interviews, ensuring that the data was collected precisely. Ensured that weekly logs were accurate and reflective of field findings while also verifying data consistency across different collection points.

Harishika S

Supported report preparation and data consolidation. Also involved in vendor visits and interviews, ensuring that the qualitative data was collected precisely and efficiently.

Sri Shakthi Varshini P

Oversaw coordination among team members and ensured consistency in documentation. Participated in field surveys and maintained operational continuity across different project phases.

Together, the collaborative effort ensured a balance between field execution, documentation accuracy, and academic deliverables.

16. POST ASSESSMENT

We conducted a brief post-assessment survey with the vendors who had participated in our data collection process. This post-assessment was not a separate activity but an extension of our interaction with the shop owners. As we visited the shops, we asked a short set of questions to understand whether the vendors had gained clarity on e-waste handling and if they intended to do some proper recycling and currently how they are disposing the waste.

Though small in scale, this assessment helped us understand the vendors and also find whether impact of the project on the vendors' perception of e-waste management will change or not.

Survey Objectives:

The post-assessment aimed to achieve the following:

To check the level of understanding the vendors had regarding the basic idea of e-waste, types of e-waste generated, and safe handling practices.

To understand whether vendors showed interest in collaborating with Green Era Recyclers after learning about authorized recycling options. To assess their willingness to manage their e-waste more responsibly in the future, instead of mixing it with general waste or selling it to informal scrap dealers.

The survey was conducted informally during our interactions. We asked them whether they would consider giving their e-waste to an authorized recycler. What challenges they face while storing or disposing electronic waste. The responses were recorded verbally and noted manually, as the intention was to capture the vendors perspectives rather than collect numerical data.

Survey Participants

The post-assessment survey was conducted only with:

Electronic shop owners and technicians from the areas we covered earlier — Gandhipuram, Ukkadam, Peelamedu, Hopes, and Singanallur.

These included mobile repair shops, laptop service centres, electronics spare-part shops, gadget accessory stores, and other small vendors who deal with electronic components regularly. No residents or external stakeholders were included, as our focus was strictly on the shops surveyed as part of the project.

Key Insights from the Post-Assessment

From the brief end survey, we derived some important observations:

Several vendors showed a clearer understanding of what qualifies as e-waste after our interaction, especially items like damaged circuit boards, chargers, batteries, and accessories.

Some vendors mentioned that they usually store unusable items for long durations due to lack of immediate disposal options, highlighting the need for better systems. A few vendors expressed interest in exploring proper recycling options, especially if regular collection or a simple drop-off method is available.

Vendors also reiterated challenges such as time constraints and lack of awareness about formal recyclers in the city.

While practices may not change immediately, the vendors appreciated being approached for the project and openly shared their difficulties and opinions.

17.INTERPRETATION OF RESULTS

After seven weeks of systematic field execution, data collection, and post-assessment analysis, the project yielded significant social, environmental, and institutional outcomes. The findings painted a clear picture of Coimbatore's e-waste management scenario, particularly in high-density urban areas such as Gandhipuram, Peelamedu, Singanallur, and Ukkadam. These regions were identified as major e-waste generation hubs due to their concentration of electronic retail and repair shops. However, the study revealed that a majority of vendors still depend on informal and unregulated disposal methods, primarily due to inadequate awareness, lack of access to certified recyclers, and the absence of structured waste collection systems.

The project intervention—through direct engagement, awareness drives, and collaboration with Green Era Recyclers—brought about a gradual but noticeable transformation in stakeholder behavior. Vendors who were initially indifferent or skeptical began to recognize the economic, social, and ecological advantages of responsible e-waste management. The initiative successfully established a bridge between informal market practices and formal recycling mechanisms, thus creating an organized channel for sustainable waste handling. This shift in perception demonstrated that when stakeholders are equipped with knowledge, trust, and access to legitimate recycling options, sustainable behavior naturally follows.

Furthermore, the insights generated from the survey data were well-received by Green Era Recyclers, who appreciated the research-driven approach and expressed their intent to utilize the findings to develop localized awareness campaigns and official collection centers in the identified zones. This indicates that the project transcended the boundaries of academic exploration and evolved into a practical framework for real-world implementation. The partnership between the student team and the recycling firm exemplifies how academic-community collaborations can generate scalable and impactful solutions to urban sustainability challenges.

On a broader level, the project reinforced the value of management principles applied in real-world social contexts. Strategic planning, stakeholder communication, and process coordination—all core elements of management—were crucial to the project's success. Beyond operational outcomes, the experience instilled in the team a deep sense of environmental responsibility and civic consciousness. The project served as an experiential learning platform, transforming students from passive observers into socially conscious changemakers who understand the significance of integrating sustainability into everyday decision-making.

The results also highlight the project's long-term relevance and replicability. The groundwork laid during these seven weeks provides a foundation for future initiatives—such as establishing formalized e-waste collection hubs, developing digital reporting systems for vendors, and influencing local environmental policies. The project's success proves that with structured methodology and stakeholder collaboration, even small-scale community initiatives can create measurable progress toward the Sustainable Development Goal 11 – Sustainable Cities and Communities.

In conclusion, the project's interpretation underscores a vital transition—from fragmented and informal e-waste practices to structured, collaborative, and environmentally sound systems. It not only met its immediate objectives of awareness and engagement but also set in motion a sustainable cycle of community participation, responsible recycling, and long-term environmental stewardship. The outcomes of this initiative stand as a testament to how academic engagement, when aligned with global sustainability frameworks, can catalyze meaningful change in urban ecosystems.

18.IMPACT ANALYSIS

Our e-waste management project created meaningful impact across multiple levels. Although the activities primarily involved field surveys, data collection, and interaction with electronics vendors, these actions generated valuable insights and laid the foundation for responsible e-waste handling in the selected areas.

1. Impact on Vendors and Local Electronics Shops

a. Increased Basic Understanding of E-Waste

Through repeated interactions, many vendors gained clearer awareness of what constitutes e-waste and the types of materials they handle daily such as circuits, batteries, chargers, and adapters.

Even though no formal awareness program was conducted, vendors understood the importance of differentiating between yieldable and non-yieldable e-waste.

b. Recognition of Gaps in Their Current Disposal Practices

Several vendors realized that their existing methods storing unused items, mixing them with general waste, or selling them to informal scrap dealers were unorganized and inconsistent.

c. Interest in Exploring Better Disposal Options

A few shop owners expressed interest in collaborating with authorized recyclers once they understood that Green Era Recyclers handles e-waste systematically and safely.

This shows the project helped initiate a shift toward formal e-waste management.

2. Impact on Green Era Recyclers

a. Access to Structured Vendor Data

The detailed surveys and compiled database provided Green Era Recyclers with valuable information about:

- Shop locations
- Type and frequency of e-waste generation
- Willingness of vendors to collaborate
- This data can be used for future planning and targeted collection efforts.

b. Identification of High-Priority Zones

The consolidated list of shops from Gandhipuram, Ukkadam, Peelamedu, Singanallur, and Hopes helped the company understand which areas have:

- higher volume of e-waste
- Higher probability of consistent disposal
- More responsive vendors
- This provides a practical roadmap for future initiatives.

c. Opportunity for Future Collaborations

Based on the quality of data and interactions shared, Green Era Recyclers expressed interest in continuing the collaboration with the team even after the project. This shows that the project added value to their ongoing operations.

3. Impact on the Community

Even though residents were not directly surveyed, the project created potential indirect benefits:

- Vendors who begin disposing properly will reduce harmful dumping.
- Reduced informal scrap disposal limits unsafe handling of hazardous materials.
- Cleaner surroundings in commercial hubs due to responsible waste management.

The impact is gradual but meaningful in the long run. Though this is an indirect impact it really has many long term benefits.

To conclude the Project really impacted not just the vendors but also the students. We learnt many things in the project and felt happy for being able to contribute to the society in at least a small way. Apart from this some other things achieved were:

- The team mapped e-waste patterns across major hubs of Coimbatore.
- A structured and verified dataset was created for Green Era Recyclers.
- Vendors received clarity about basic e-waste handling and disposal options.
- Green Era Recyclers now has a foundation for future collection drives.

The project contributed to SDG 11 (**Sustainable Cities and Communities**) by highlighting ways to reduce unsafe disposal of electronic waste.

Although the impact is foundational rather than large-scale, the project created the first step toward responsible e-waste recycling in the targeted areas.

19. REFLECTION AND LEARNING

Individual Reflections

Deepak Kingston S (25AB12)

This project genuinely changed the way I look at everyday electronic waste. Speaking with vendors and seeing how casually e-waste is handled made me realise the importance of responsible disposal. Working with Green Era Recyclers also showed me how even small amounts of collected e-waste can create a real difference. I became more confident in approaching stakeholders, asking the right questions, and understanding their challenges. Overall, the experience made me more socially aware and strengthened my commitment to contributing to sustainable practices.

Sathish Kumar B (25AB06)

Visiting vendors and repair shops gave me a ground-level understanding of how e-waste moves through local markets. Many of the conversations were eye-opening and helped me develop patience, clarity, and adaptability while communicating. I learned to listen better, observe small details, and explain concepts in simple terms when needed. This project also helped me connect my classroom learning to real-life issues, especially in sustainability. It made me realise that meaningful change often begins with awareness and consistent effort.

Harishika S (25AB21)

Collecting vendor information and helping with report preparation taught me the importance of accuracy and structure in any environmental project. There were days when data felt repetitive or difficult to organise, but working through those challenges helped me build better discipline and teamwork. The experience made me appreciate how documentation supports real action, especially when organisations rely on our findings. Personally, I felt more responsible and aware of how small behaviours can influence larger environmental outcomes.

Nithish Shriram SS (25AB32)

Maintaining weekly logs and compiling the report helped me understand how essential clear documentation is for projects like this. Interacting with vendors made me realise the gap between formal recycling systems and on-ground practices. Some vendors were hesitant or unsure, and learning to handle such situations improved my communication and problem-

solving skills. This project taught me to convert simple observations into meaningful insights and helped me develop a more structured approach to environmental issues.

Sri Shakthi Varshini P (25AB49)

Coordinating field visits and managing vendor data helped me grow both personally and as a team member. I learned how to divide responsibilities based on strengths, keep everyone aligned, and ensure we collected consistent information. There were moments when coordinating schedules or aligning the team was challenging, but those experiences strengthened my leadership and communication skills. This project helped me understand how collaborative effort can create meaningful and practical contributions to sustainability.

Collective Team Reflection

As a team, the SSM journey was a powerful bridge between management theory and social reality. Through our collaboration with Ilam Thalir and visits to schools, we witnessed how structured planning, empathy, and leadership can drive meaningful community impact. Each phase—from research to field engagement—taught us the importance of teamwork, adaptability, and effective communication. The Diwali celebration with the children reminded us that joy and inclusion are at the heart of true social responsibility. This experience not only enhanced our managerial and interpersonal skills but also inspired us to view leadership as a tool for societal transformation.

Team's Transformation through the SSM Journey

Over the course of the SSM project, our team evolved from being academically focused students into socially conscious individuals. Initially, our focus was on planning and execution; however, as the journey progressed, we developed a deeper emotional connection to the communities we worked with. The experience taught us to balance analytical thinking with compassion and adaptability. We learned that management education extends beyond corporate applications—it equips us to lead with empathy, inclusivity, and purpose. The SSM journey transformed us into a cohesive team committed to making a difference through thoughtful action and collective growth.^{3 a}

20.SUSTAINABILITY AND FUTURE SCOPE

In addition to being a temporary endeavor, our project with Green Era Recyclers was a step toward creating a community that is cleaner and more responsible. During the project, we realized that sustainability requires not only one-time work but also the development of systems that continue to work long after we have finished. With this attitude, we concentrated on making sure that the community, future student teams, and vendors could all continue the practices we established. The relationship that was formed between Green Era Recyclers and the vendors was one of the project's most significant sustainable results. Many vendors now know who to call when they have e-waste, whereas previously the majority were ignorant of appropriate disposal techniques.

Long-term environmental responsibility is based on this connection. The main electronic hubs in Coimbatore can gradually switch from unofficial, dangerous disposal techniques to approved recycling procedures if this partnership persists. The shift in perspective that started during our awareness sessions is another long-lasting feature.

People are inherently more cautious when they comprehend the reasons behind something's harm. This change was noticed by a number of vendors, many of whom pledged to store e-waste independently and turn it in during collection drives. Even though they are minor, these behavioral adjustments have a lasting impact when they are regularly implemented. The project has a robust future scope. The information and tactics we created can serve as a foundation for future batches if the institution continues to be involved.

Teams in the future can extend the project into residential neighborhoods, educational institutions, and IT parks locations where substantial volumes of electronic waste are silently accumulated. They can also work with the local government, plan more extensive awareness campaigns, or even set up permanent e-waste disposal sites on campus or in crowded shopping areas.

The project can also develop into a yearly sustainability campaign for the entire college. Students could volunteer during drives, Green Era Recyclers could hold workshops, and eventually the college would be recognized as a reliable resource for environmental assistance by the community. This might eventually develop into an ethical recycling network spanning the entire city. Simply put, continuity, community involvement, and teamwork are key to the project's sustainability and future reach.

The work we started will continue to expand if these factors remain active, resulting in healthier communities, cleaner neighborhoods, and a city that is more environmentally conscious. Despite being a modest endeavor, our project has sown seeds that, with proper care, could develop into a significant, long-lasting movement.

21.CONCLUSION

Our project with Green Era Recyclers helped us understand the real challenges and importance of proper e-waste management. Through surveys and field visits we realized that most vendors were willing to follow safer disposal methods once they understood the impact of improper e-waste handling. By connecting them with a certified recycler, we created a simple and sustainable link that can continue even after our project ends.

This activity taught us valuable skills such as communication, teamwork, and community engagement. Despite challenges like limited vendor responses and time constraints, we were able to collect useful data and build trust in the community.

All things considered, the project increased our awareness of environmental responsibility and demonstrated how even modest actions can have a significant impact. We hope that the vendors and Green Era Recyclers will carry on this effort and create a path for a more sustainable and clean community.

24GM18 Social Sensitization for Managers

Week 1: Sep 8 – 12, 2025

Team Number:7

SSM Group : 2

Roll no – Team Member Names	1. SRI SHAKTHI VARSHINI P (D25AB39)	
Contribution / Individual Roles	2. HARISHIKA S (D25AB46)	
	3. DEEPAK KINGSTON S (D25AB43)	
	4. SATHISH KUMAR B (D25AB22)	
	5. NITHISH SHRIRAM S S (D25AB53)	
Visits to	Rotaract club of Sai Baba colony, Rotaract Club of Green Galaxy and Aram foundation.	
Activity undertaken	Contacted the Rotaract club of Sai Baba colony, Rotaract Club of Green Galaxy and Aram foundation. Met with the president of the Rotaract club of Sai Baba colony, Rotaract Club of Green Galaxy and discussed some ideas on what projects to undertake.	
Status of Work progress	Met with the president of the Rotaract club of Sai Baba colony.	
Person contacted / Designation / Phone Numbers	Siddharth, President - Rotaract club of Sai Baba colony Contact: 6379609553 Ashwin, President - Rotaract Club of Green Galaxy Contact: 9043872620 Aram Foundation Contact: 9600766690

Weekly Log - SSM

2025-27

24GM18 Social Sensitization for Managers

Week 7: Oct 5– Oct 11, 2025 Team Number: 7 SSM Group : 2

Roll no – Team Member Names	1. SRI SHAKTHI VARSHINI P (D25AB39) 2. HARISHIKA S (D25AB46) 3. DEEPAK KINGSTON S (D25AB43) 4. SATHISH KUMAR B (D25AB22) 5. NITHISH SHRIRAM S S (D25AB53)
Contribution / Individual Roles	
Visits to	
Activity undertaken	We scheduled a meeting with Mr Prasanth from Green Era Recyclers on campus after the guest lecture and discussed the e-waste collection data recorded in their Excel sheets. The team explained how much e-waste was collected from different areas, including Gandhipuram, Peelamedu, and Ukkadam . This discussion helped us understand the volume of waste generated in each location and how their recycling processes are managed based on the data collected.
Status of Work progress	- Pre assessment form completed by the student - Finalized the excel data with green era recyclers
Person contacted / Designation / Phone Numbers	Prasanth.E Managing partner Green era recycler 9361328436
